

a

recovery tracks pool burial

5 overlapping pools of 13,412 interface positions

**b**

and it dissolves under matching

ProBiD-Net's own voxel-CNN, our fixture

**c**

no architecture keeps a hotspot deficit once burial is matched

same pre-registered matched pairs · paired within complex

whiskers = 95% complex-clustered bootstrap CI (10,000 replicates, seed 20260803); filled mark = CI excludes zero.

Δ SASA is the one cheap hotspot feature the matching does not control, so it is checked separately: the 384-pair tier carries a Δ SASA imbalance of +0.072 [+0.045, +0.100], and adjusting the gap for it moves it only -0.042 → -0.028 nats.
