

a

every interface metric moves the same way

paired Δ (L – random), mean over k · n = 60 complexes (58 for pAE, composite)

whiskers = 95% CI, complex-clustered bootstrap · $P(>0) = 1.00$ on every row

unit families are drawn on their own scales; ipTM and global pTM share one

b

direction, not magnitude

ipTM · n = 60 complexes
