

a

the same complexes are hard under both

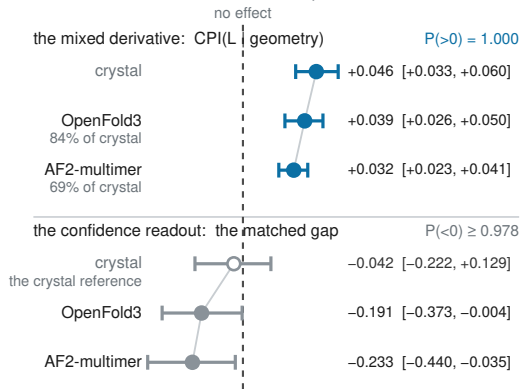

burial-matched gap per complex, nats · n = 127

AF2-multimer backbone

**b**

leverage holds where confidence fails

the same two scorers, re-run on the predicted backbone

b, upper block: CPI(L | burial + neighbours + Δ SASA), mutation level, 2,520 mutations over 140 shared complexes; lower block: the burial-matched paired design in nats, 382 pairs / 127 complexes predicted (384 / 129 crystal). The two blocks are different quantities: each is on its own scale and every value is printed, so only the sign is compared. 95% complex-clustered bootstrap CIs.
